

# the plugbot

PlugBot is a covert penetration testing device designed for use during physical penetration tests. Its a tiny computer the size of a power adapter; this small size allows it to go physically undetected reducing face-to-face social engineering interaction. All the while, the PlugBot is powerful enough to **covertly** scan, collect and deliver test results externally.

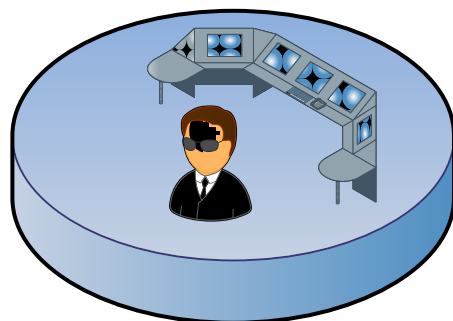

## Target Building

## Drop Zone

Drop Zone stores data uploaded from the PlugBot

## Central Command

Pen Tester analyzes data thru a web interface and issues new PlugBot scan commands

## PlugBot Deployment

Physically deploy the PlugBot inside the target building, such as a conference room
